EDUCATION

University of Michigan

May 2028

B.S.E. Computer Science, Minors in Physics and Math

3.9 GPA

Coursework: Distributed Systems, GPU Parallel Programming, Data Structures and Algorithms, Computer Organization, Discrete Math, Modern Physics, Physics III, Computer Science Pragmatics, Proof-Based Linear Algebra

Involvement: V1 Michigan, Michigan Investment Group (Quant), Chinese Student Association, Resident Advisor

EXPERIENCE

Amazon Web Services

Jun. 2026 - Aug. 2026

Software Development Engineering Intern | Parallel Computing Service

Boston, MA

- Developed CloudWatch monitoring infrastructure for 1,500+ ECS agents on cluster-management EC2 instances worldwide, adding logs, alarms, dashboard metrics, and runbook workflows to support on-call troubleshooting
- Refactored cluster monitoring architecture to improve request-rate headroom by 25x for production systems
- Worked across engineering teams and product team to implement customer-facing cluster capacity metrics to improve user visibility on compute node states, billing information, and potential program failures
- Created AutoSDE rule to proactively catch lack of cross-account API permissions in new code review changes
- Contributed to internal code review tool by integrating tab persistence when switching panels

V1 Michigan

Jan. 2026 - May. 2026

Product Studio Member and Community Team

Ann Arbor, MI

- Built Syllog, a full-stack strategy builder for prediction markets using Next.js, React, and Go with a visual node-based editor for composing market, logic, and trading workflows and ability to deploy to Kalshi
- Created Slack agent for information retrieval and website improvements to streamline internal team operations
- Developed Startup Week talent matching portal connecting 20+ startups with 180+ students

FIRST Robotics Competition Team 1076

Sep. 2021 - May. 2025

Engineering Captain

Ann Arbor, MI

- Directed a 70-person team to design, build, and program three robots, managing the entire engineering process, coordinating cross-team collaboration, and ensuring timely project completion and success
- Transformed software stack by migrating from Python to Java, adopting functional programming practices, and improving odometry precision, computer vision reliability, and motion control accuracy
- Advanced team ranking from 40th percentile to 93rd percentile worldwide in three years during leadership tenure

PROJECTS

HackMIT - Sift (4th out of 300 projects)

Sep. 2026

- Built reimbursement reconciliation API routes combining typed Jev decisions with deterministic policy checks
- Parallelized Jev semantic claim search with database-backed retrieval and bounded retries for provider rate limits
- Added Command-K navigation and expandable audit summaries to streamline claim lookup and exception review

Microsoft Imagine Cup - GlitterCode

Dec. 2025 - Jan. 2026

- Built AI-assistant block coding platform for students; validated and iterated features with 8 students and 2 teachers; developed pitch deck and recorded pitch and demo to explain product, PMF, and GTM strategy
- Used FastAPI backend with WebSockets to communicate with Next.JS frontend for learning features; integrated Microsoft Foundry and Microsoft AI services to create four specialized LangGraph AI agents
- Deployed Docker Containers for frontend and backend through Microsoft Azure Container Apps service

F1 Racing Game

Feb. 2023 - Mar. 2023; Aug. 2025

- Developed a racing game in Unity with C#, featuring computer-controlled opponents and fast-paced gameplay
- Utilized Unity's reinforcement learning framework to train AI models to race optimally against other cars

TECHNICAL SKILLS

Languages: Java, Python, C, C++, C#, Go, CUDA, TypeScript, HTML/CSS

Developer Tools / Frameworks: Git, AWS, Azure, Vim, Tmux, Unix, LangGraph, React, Docker
